I1. Document Language

Symptom: Original HTML didn't specify a language

Cause: Opening <html> did'nt contain a lang attribute

Correction: I added lang="en-US" to the opening html

Evidence: MDN - HTML lang attribute (https://developer.mozilla.org/en-US/docs/Web/HTML/Reference/Global_attributes/lang)

Verification: Saved index file and confirmed the corrected element was present in Chrome's view page source.

I2. Mobile Viewport

Symptom: The document was missing from the metadata used to configure the mobile viewport.

Cause: The <head> section lacked viewport meta element

Correction: I added the viewport metadata specifying width=device-width and initial-scale=1.

Evidence: MDN- <meta name=”viewport”> HTML attribute value (https://developer.mozilla.org/en-US/docs/Web/HTML/Reference/Elements/meta/name/viewport)

Verification: Tested the page at 320 CSS pixels. Horizontal scrolling remained, and developer tools showed a fixed-width CSS container.

I3. Navigation Link

Symptom: Resources link was not valid.

Cause: The original link used resource.html, which wasn't the right file name. The correct file name is resources.html and is located inside the pages folder.

Correction: Inserted the right path which is pages/resources.html.

Evidence: MDN- Dealing with files (https://developer.mozilla.org/en-US/docs/Learn_web_development/Getting_started/Environment_setup/Dealing_with_files)

Verification: Successful navigation test of the Resources link.

I4. Heading Hierarchy

Symptom: Inappropriate heading level in the introductory section.

Cause: The heading Start with patterns was originally an <h3> directly under the main page heading without a parent <h2> section.

Correction: I changed the heading to <h2>

Evidence: MDN- <h1>-<h6> HTML section heading elements (https://developer.mozilla.org/en-US/docs/Web/HTML/Reference/Elements/Heading_Elements)

Verification: Updated <h2> element was visible on the webpage.

I5. Image Alternative Text

Symptom: The cactus illustration had a bad alternative-text description.

Cause: The image used alt="image123", which didn't describe the image content.

Correction: I chose "desert dunes with cactus and sun" as a description.

Evidence: MDN <img> HTML image embed element (https://developer.mozilla.org/en-US/docs/Web/HTML/Reference/Elements/img)

Verification: new alt text appears when I go to inspect HTML elements.

R1. Resources Page Stylesheet

Symptom: Resources page wasn't loading the stylesheet correctly.

Cause: The original path didn't account for resources.html being inside of the pages folder.

Correction: I changed the style sheet path, so it reaches the parent folder before going into the CSS.

Evidence: MDN: Dealing with Files (https://developer.mozilla.org/en-US/docs/Learn_web_development/Getting_started/Environment_setup/Dealing_with_files)

Verification: I verified that the stylesheet loaded and the page displayed the correct items.

R2. Resources Link Correction

Symptom: Two links contained the wrong path back to the home page.

Cause: The incorrect path was input for two links back to the homepage. Added ../ to the beginning of the file path to have the links corrected.

Correction: I added ../ to the beginning of the file path to have the links corrected.

Evidence: MDN: Dealing with Files (https://developer.mozilla.org/en-US/docs/Learn_web_development/Getting_started/Environment_setup/Dealing_with_files)

Verification: When I clicked on the heading and home links, it took me to the home page.

C1. Keyboard User

Symptom: Keyboard users don't see link selection while using keyboard navigation.

Cause: focus {outline: none;} is coded into the style.css.

Correction: I input a updated code {outline 4px solid blue:} to help keyboard navigation and link selection identification.

Evidence: MDN outline CSS property (https://developer.mozilla.org/en-US/docs/Web/CSS/Reference/Properties/outline)

Evidence: After updating the code, refreshing the page, and navigating with the Tab key, the active links were showing a blue outline.

C2. Page Overflow Issue

Symptom: Page width is set to 1100px meaning the page won't go any less than that without horizontal scrolling needed.

Cause: Page width is set to 1100px.

Correction: I changed the width to auto and put max-width to 1100px, and tested a narrower page dimension. The page links moved with the width of the page, and I didn't need any horizontal scrolling.

Evidence: MDN max-width CSS property (https://developer.mozilla.org/en-US/docs/Web/CSS/Reference/Properties/max-width)

Verification: While using responsive mode, I was able to verify the page was adjusting to the viewport correctly.

C3. Card Grid shrink/wrap issue

Symptom: The grid required horizontal scrolling.

Cause: The cause was that the columns had fixed widths of 300px.

Correction: I changed the code to repeat (auto-fit, minmax(300px, 1fr) in order to negate the horizontal scrolling and enabled the cards to adjust according to the view.

Authority: MDN grid-template-columns CSS property (https://developer.mozilla.org/en-US/docs/Web/CSS/Reference/Properties/grid-template-columns)

Verification: The grid was adjusting to the viewport without any horizontal scrolling.

C4. Card Styles:

Symptom: Identified that #featured was overriding the background color of the card.

Cause: After inspecting the card in Chrome, I found the ID selector was overriding the class selector background color.

Correction: I deleted the ID selector and found that the class selector didn't have a line through it in inspection mode. The color changed to the correct color in .featured.

Evidence: MDN Specificity (https://developer.mozilla.org/en-US/docs/Web/CSS/Guides/Cascade/Specificity)

Verification: After changing the code, I verified that the correct color background was visible and correctly displayed.

C5. Min/Max Width

Symptom: I found that the @media (min-width: 700) and (max-width:500) was coded into the stylesheet.

Cause: Two rules were contradicting each other and weren't valid.

Correction: I found that having a max-with of 700 was the correct fix since it would still show properly in mobile views.

Evidence: MDN Using media queries (https://developer.mozilla.org/en-US/docs/Web/CSS/Guides/Media_queries/Using)

Verification: After changing the code, I was in Responsive mode and change the viewport to 320px which showed the header stacked vertically and at 900px the header was on the same line across the page.
